Environmental Protection Agency report No. EPA-600/5-74-028

16. Abstracts

This computer-listed bibliography includes approximately 3,000 references to environmental quality management issues. The primary selection criteria for including the sources referenced was that the citation pertains to water pollution control benefits and costs. However, numerous listings include more general environmental issues within which water quality problems are embedded. Also, much of the economic cost-benefit analysis research has been conceptually developed and/or applied in resource-use areas other than water. Such concepts were often considered germane to water resources research even though water related applications were not found in the literature search. Therefore, this publication does include selected references outside the water resource research area, per se.

The bibliography is arranged alphabetically, by author. Both literature sources and terms used in titles were often abbreviated to conserve space; such abbreviations were defined in the attached glossary. Literature sources included books, journal articles, trade publications, research reports, and unpublished reports pertaining to on-going research within both public and private agencies.

BIBLIOGRAPHY OF
WATER POLLUTION CONTROL BENEFITS AND COSTS

PREFACE

The attached computerized bibliography of water pollution control benefits and costs was developed for the Environmental Protection Agency by Development Planning and Research Associates, Inc.

It was developed as one part of a project which is directed toward extrapolating regional estimates of water quality enhancement programs in order to arrive at preliminary national estimates of water pollution control benefits and costs.

Stage 1 of this project required the performance of a literature search of published research in this field and the development of a computerized bibliography of published research in this field. The bibliography includes approximately 3,000 relevant references, alphabetized by author and constitutes the most extensive literature search available on this subject. The references listed have been screened and are considered relevant to the problems inherent in estimating water pollution control benefits and costs.

The attached glossary of abbreviations of literature sources and terms identifies those used in the bibliography.
